

641st ASRC Seminar

Date: 13:30 ~ Thursday, July 7

Location: Meeting Room 103, ASRC bldg.

Speaker: Professor Manuel Ricardo Ibarra
(University of Zaragoza)

Title: Relevance of the surfaces in thermospin
and spintronics effects

•**Abstract:** This talk covers the role of the surfaces in relevant effects discovered in the field of spintronics: On one hand, the role of Non-Magnetic metal/Ferromagnet interfaces, that give rise to a strong enhancement of the spin Seebeck effect in $\text{Fe}_3\text{O}_4/\text{Pt}$ multilayer due to the magnon spin currents conversion in electron spin currents and vice versa through the heterostructure. [1] On the other hand, the relevance of the surface states in Bi and Bi based compounds. Thin films of Bi provide a nice scenario for the observation of WAL effect in magnetotransport properties. [2] Time reversal symmetry (TRS) protection of surface states (SS) gives rise to the absence of backscattering in topological insulator (TI) as Bi_2Te_3 , giving rise to spin-polarized and dissipation-less charge currents. The presence of magnetic adatoms, as Co, at the surface of a TI, can destroy the TR symmetry; this is the case of Bi_2Se_3 . However, we have found that in $\text{Bi}_2\text{Te}_2\text{Se}$, the surface chemical inhomogeneity (Te/Se) preserves the TRS of the topological SS.[3]
