

# Chiral symmetry for hadrons

Atsushi Hosaka

RCNP/ASRC

Lecture at TPI/ASRC, JAEA

May 10, 2017

## Contents

### 1. Introduction and Basics

Hadrons, chiral symmetry and SSB

### 2. The NJL model

Gap equation and pion eq. of motion

### 3. Pion (NG boson) interactions

### 4. Skyrmions and $KN$ interactions

# 1. Introduction

## General references

S. Weinberg, The Quantum Theory of Fields II, Cambridge, 1995

S. Coleman, Aspects of symmetry, Cambridge, 1985

Y. Nambu and Jona-Lasinio, Phys. Rev. 122, 345; 124, 246 (1961)

A. Hosaka and H. Toki, Quarks, Baryons and Chiral Symmetry, World Scientific, 2001.

A system is **chiral** if it is **distinguishable** from its mirror image  
= with degenerate energies

# Hadrons: *Composites* of quarks and gluons of QCD

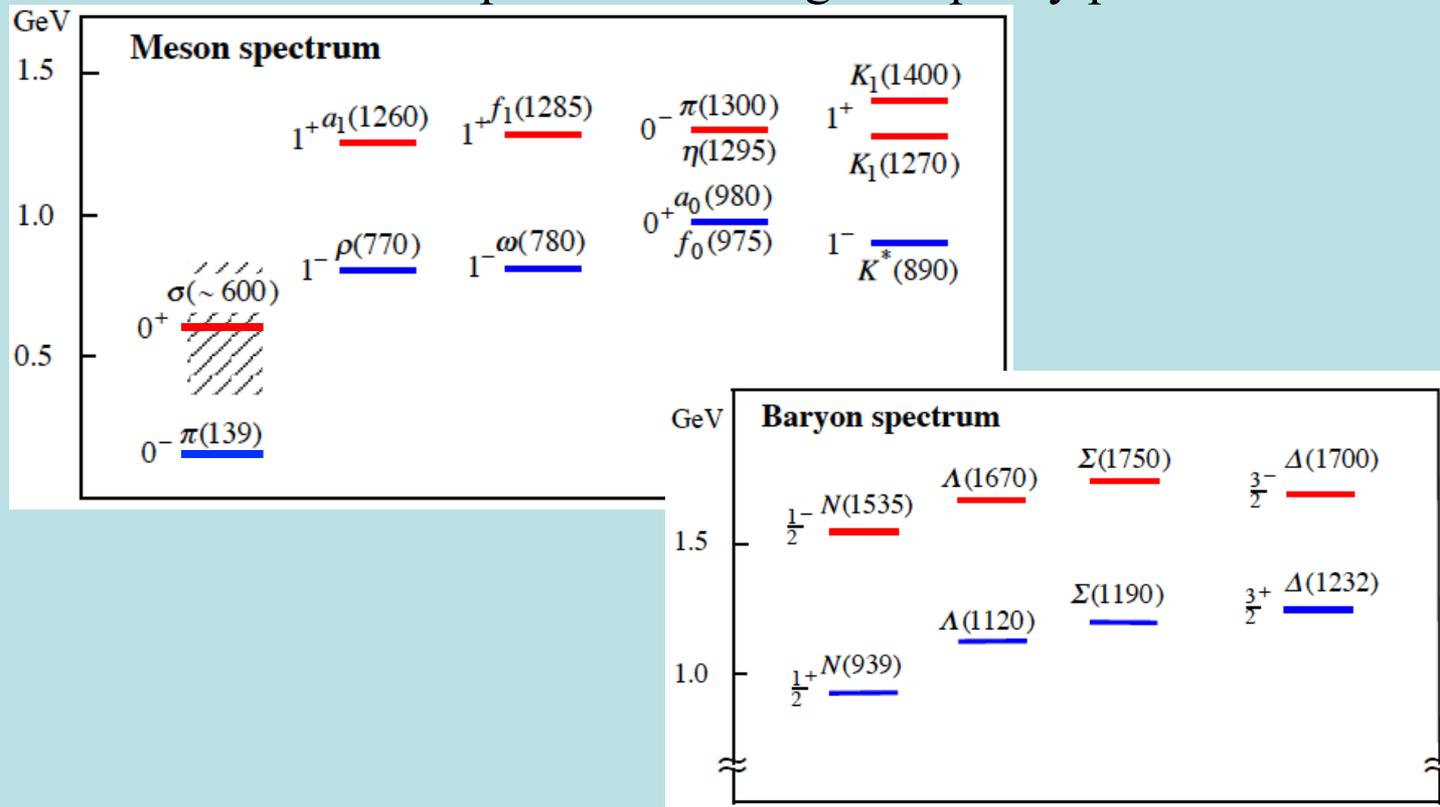

$$\mathcal{L} = \sum_f \bar{q}_f (i\not{D} - m_f) q_f - \frac{1}{2} \text{tr} G_{\mu\nu} G^{\mu\nu}$$

- *Color SU(3) gauge theory* of the standard model
- **6 flavors, u, d, s (~ light)** // c, b, t (~ heavy)
- *Non-perturbative* (large coupling) at low energies, for u, d, s
- Confinement, **SSB** and mass generation → *Millennium problem*
- Hadrons emerge as *baryons* (**qqq**) and *mesons* (**q $\bar{q}$** )
- *Lattice QCD* is the first principle method
- Successful for *static properties*; masses and FF
- But not yet for *dynamic properties*, resonances and reactions
- Important ideas and methods are explored by *effective theories*
- *Chiral symmetry* and **SSB** explain many hadron properties

# Hadrons of opposite parities should degenerate BUT NOT Indicating SSB

Jido, Oka, Hosaka, PTP106 (2001) 823

Masses of positive and negative parity particles

# Are hadrons $qqq$ or $q\bar{q}$ ?

Mesons

# Superconductor vs Hadron

	Super conductor	Hadron systems
System	Metal, conductor Many electrons	Vacuum Many quarks and anti-quarks
Particles and Interaction		
Order parameter	$\langle ee \rangle$	$\langle \bar{q}q \rangle$
Mass Gap	Majorana mass	Dirac mass
Zero mode	Super fluid	Pions
Two phases		

# Chirality of fermions

Related to the representations of the **Lorentz group**: Relativity

**Rotation** and **Boost**,  $SL(2,C)$

Generators,  $R$  and  $B$

$(R+iB)$ : **Right** handed fermion

$$\psi = \psi_R + \psi_L$$

$(R-iB)$ : **Left** handed fermion

$$\psi_{R,L} \equiv \frac{1 \pm \gamma_5}{2} \psi$$

Two comp. each

Four comp.

- $R$  and  $L$  numbers are conserved separately  $\rightarrow$  **chiral symmetry**
- Fermion number conserving **mass term** is possible by **mixing the  $R$  and  $L$**  components  $\Rightarrow$  **breaks Chiral symmetry**

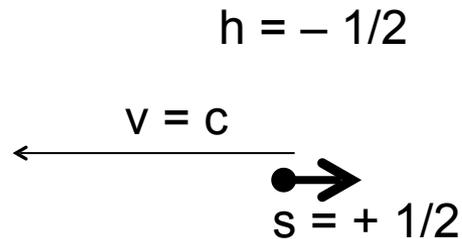

$$L = \bar{\psi} (i \not{\partial} - m) \psi = \bar{\psi}_L i \not{\partial} \psi_L + \bar{\psi}_R i \not{\partial} \psi_R - m \bar{\psi}_L \psi_R - m \bar{\psi}_R \psi_L$$

- This is the reason that Dirac equation needs four components

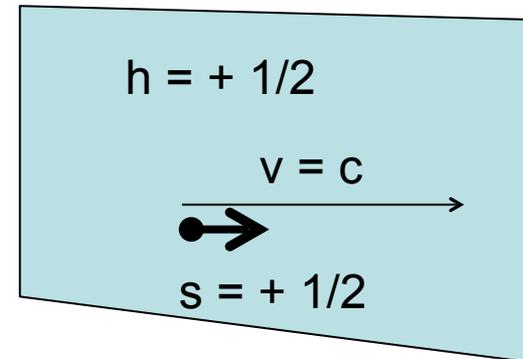

Physically,

- $L$  and  $R$  components correspond to *helicity* states
- For a particle moving at the speed of light,  $L$  and  $R$  are conserved *massless*

*Left* helicity

*Right* helicity

- Left transformation:  $\psi_L \rightarrow e^{i\theta_L} \psi_L \xrightarrow{\theta_L = \pi} -\psi_L$
- Parity eigenstates (under  $L \rightleftharpoons R$ )

$$\left. \begin{aligned} \psi_+ &= \psi_L + \psi_R \\ \psi_- &= -\psi_L + \psi_R \end{aligned} \right\}$$

$$\psi_+ \xrightarrow{\text{L transformation}} \psi_-$$

## 2. The NJL Model

Y. Nambu and Jona-Lasinio, Phys. Rev. 122, 345; 124, 246 (1961)

# The NJL Model

- A model for relativistic and *massless fermion*
- Assign particle numbers of an internal symmetry for *L* and *R* separately

$$SU(N_f)_L \times SU(N_f)_R \xrightarrow{\text{Fundamental representation}} \left(\frac{1}{2}, 0\right) + \left(0, \frac{1}{2}\right) = \psi$$

- With a chiral invariant *four point (zero range) interaction*

$$L_{NJL} = \bar{\psi} i \not{\partial} \psi + \frac{g}{2} \left[ (\bar{\psi} \psi)^2 + (\bar{\psi} i \gamma_5 \vec{\tau} \psi)^2 \right]$$

$(\bar{\psi} \psi, \bar{\psi} i \gamma_5 \vec{\tau} \psi)$  behaves as an  $O(4)$  vector of  $SU(2_f)_L \times SU(2_f)_R$

$(\bar{\psi} \psi)^2 \rightarrow$  *Gap equation* for mass generation

$\updownarrow$  *Equivalent* due to chiral symmetry

$(\bar{\psi} i \gamma_5 \vec{\tau} \psi)^2 \rightarrow$  *Equation for massless pion, NG boson*

# Mean field in **scalar channel** - Mass generation -

$$L_{NJL} = \bar{\psi} i \not{\partial} \psi - \frac{g}{2} \left[ (\bar{\psi} \psi)^2 + (\bar{\psi} i \gamma_5 \psi)^2 \right]$$

$$= \bar{\psi} i \not{\partial} \psi - \frac{g}{2} \bar{\psi} \left[ (\bar{\psi} \psi) + (\bar{\psi} i \gamma_5 \psi) i \gamma_5 \right] \psi$$

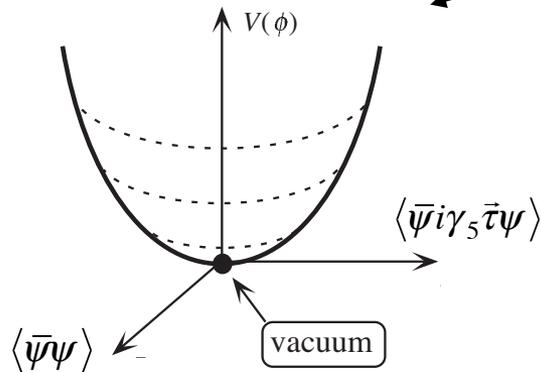

$$\rightarrow \bar{\psi} i \not{\partial} \psi - \bar{\psi} \underbrace{g \langle \bar{\psi} \psi \rangle}_{m} \psi \quad \left. \vphantom{\frac{g}{2}} \right\} \rightarrow$$

**Gap equation**

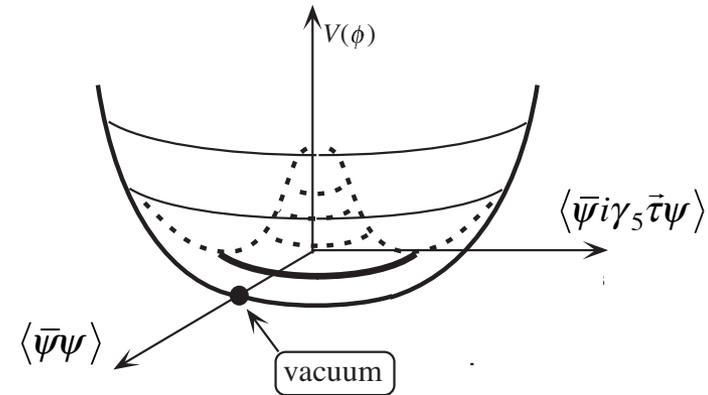

$$g \langle \bar{\psi} \psi \rangle = m$$

$$m = 2g \int_0^\Lambda \frac{d^3 p}{(2\pi)^3} \frac{m}{\sqrt{p^2 + m^2}}$$

Symmetric and  $m = 0$

Broken and  $m \neq 0$

- There is always a **trivial solution**  $m = 0$
- **Nontrivial one of**  $m > 0$  is possible for large  $g$  and  $\Lambda$   
 $\rightarrow$  Spontaneous breaking of symmetry **SSB**

# Schrodinger eq. in pion channel

土岐、保坂、相対論的他体系としての原子核、大阪大学出版会 (2011)

- Possible to solve the equation for the pion channel

$$L_{NJL} = \bar{\psi} i \not{\partial} \psi - \frac{g}{2} \left[ (\bar{\psi} \psi)^2 + (\bar{\psi} i \gamma_5 \psi)^2 \right]$$

- One can write down the Schrodinger equation

$$2\sqrt{\vec{p}^2 + m^2} \Psi(\vec{p}) - 4g \int \frac{d^3 q}{(2\pi)^3} \Psi(\vec{q}) = E \Psi(\vec{p})$$

- For  $E = 0$ , this leads to the same eq. as the gap equation  
*Massless*
- The equivalence is due to chiral symmetry
- One can write down *potential* and see *SSB* explicitly

NJL model is a simple model of SSB with mass generation and NG mode

### 3. Pion (NG boson) interaction

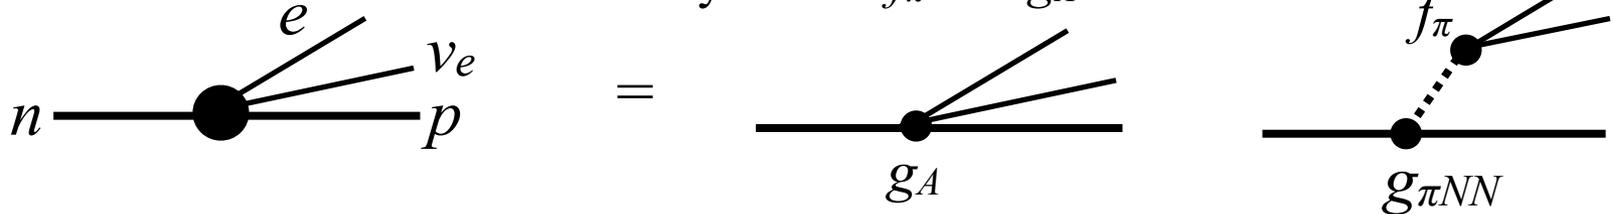

# Low energy theorems

- **PCAC ( $\sim$  CAC)**

Partially conserved axial current

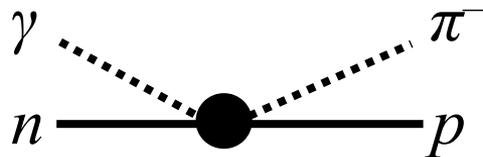

- **Goldberger-Treiman relation**

Two terms of the neutron beta decay relates  $f_\pi$  and  $g_A$

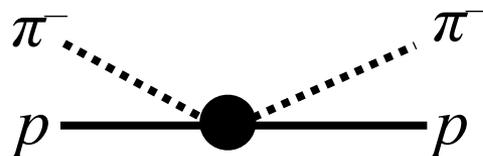

- **Kroll-Ruderman theorem**

Determines the photoproduction of the pion

- **Tomozawa-Weinberg theorem**

Determines the pion-matter interaction

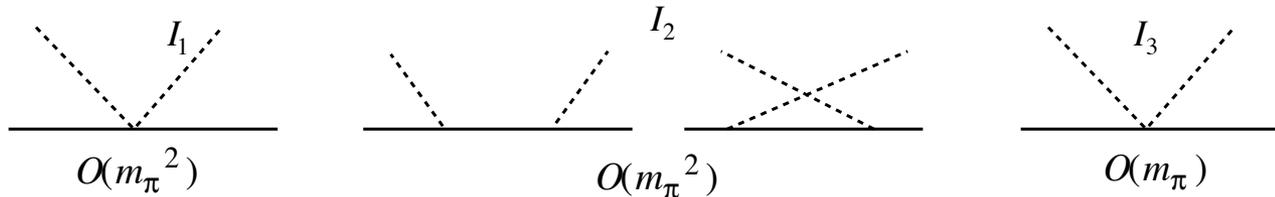

This is one of main issues in this talk

# Picture for deriving the Tomozawa-Weinberg int.

$\pi N$  scattering

$$I \sim \int d^4x d^4y e^{-iq_1 y} e^{+iq_2 x} \langle N(p_2) | T \partial^\mu A_\mu^b(x) \partial^\nu A_\nu^a(y) | N(p_1) \rangle$$

$$I = I_1 + I_2 + I_3,$$

$$I_1 = - \int d^4x d^4y e^{+iq_2 y} e^{-iq_1 x} \delta(x_0 - y_0) \langle N(p_2) | [A_0^b(y), \partial^\nu A_\nu^a(x)] | N(p_1) \rangle,$$

$$I_2 = - \int d^4x d^4y e^{+iq_2 y} e^{-iq_1 x} \partial_x^\mu \partial_y^\nu \langle N(p_2) | [A_\mu^b(y), A_\nu^a(x)] | N(p_1) \rangle,$$

$$I_3 = -i \int d^4x d^4y e^{+iq_2 y} e^{-iq_1 x} q^\mu \delta(x_0 - y_0) \langle N(p_2) | [A_0^b(y), A_\mu^a(x)] | N(p_1) \rangle.$$

Isospin current

→

$\rho$ -exchange

$$T = -i \frac{2m_\pi}{f_\pi^2} \vec{I}_\pi \cdot \vec{I}_N, \quad (I_\pi^a)_{bc} = i\epsilon_{abc}, \quad \vec{I}_N = \frac{\vec{\tau}}{2}$$

$$a_{2I} = -\frac{m_\pi}{8\pi f_\pi^2} \left(1 + \frac{m_\pi}{M}\right)^{-1} 2\vec{I}_\pi \cdot \vec{I}_N$$

$$a_1 = 0.2m_\pi^{-1}, a_3 = -0.1m_\pi^{-1}$$

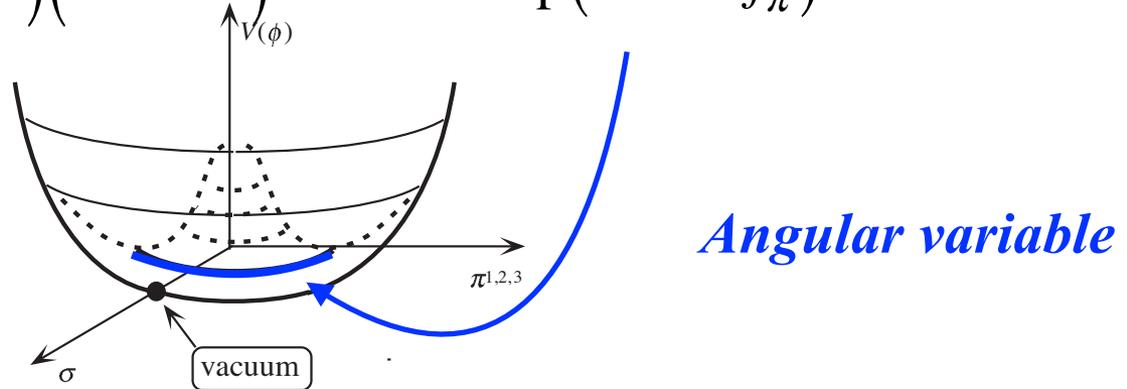

$$= -\frac{m_\pi}{8\pi f_\pi^2} \left(1 + \frac{m_\pi}{M}\right)^{-1} (I(I+1) - I_N(I_N+1) - 2)$$

$$a_1^{\text{exp}} = 0.173m_\pi^{-1}, a_3^{\text{exp}} = -0.101m_\pi^{-1}$$

# Practical method ~ Effective Lagrangians

- *Non-linear sigma model* for the pion

$$L = \frac{f_\pi^2}{4} \text{tr} \left( U^\dagger \partial_\mu U \right) \left( U^\dagger \partial^\mu U \right) \quad U = \exp \left( i \vec{\tau} \cdot \vec{\pi} / f_\pi \right)$$

The TW interaction by expanding in powers of  $\pi$

# Practical method ~ Effective Lagrangians

- **Non-linear sigma model** for the pion and nucleon

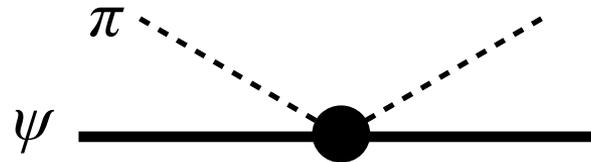

$$L_{\text{sigma}} = \bar{q}i \not{\partial} q - g f_{\pi} \bar{q} (\sigma + i \vec{\tau} \cdot \vec{\pi} \gamma_5) / f_{\pi} q \quad (\sigma + i \vec{\tau} \cdot \vec{\pi} \gamma_5) / f_{\pi} = U$$

$$= \bar{q}i \not{\partial} q - g f_{\pi} \bar{q} U^{1/2} U^{1/2} q \quad \psi = U^{1/2} q$$

$$\rightarrow \bar{\psi} i \not{D} \psi - g f_{\pi} \bar{\psi} \psi \quad D_{\mu} = \partial_{\mu} - i v_{\mu}$$

$$v_{\mu} = -\frac{i}{2} \left( (\partial_{\mu} U^{-1/2}) U^{1/2} + (\partial_{\mu} U^{1/2}) U^{-1/2} \right) \sim [\partial_{\mu} \pi, \pi]$$

$$L_{\text{int}} \sim \bar{\psi} i \not{D} \psi \sim \bar{\psi} [\partial_{\mu} \pi, \pi] \gamma^{\mu} \psi$$

The leading term is  $\mu = 0$ , proportional to the mass of the pion

- Extended SU(3) (Kaon) interaction is  $\sim m_K$ , and with **CG coeff.**
- **Strong attraction** for  $\bar{K}$  (not for  $K$ )
- Accommodates the **hadronic molecule**  $\sim \Lambda(1405) \sim \bar{K}N$
- **Problem: point-like interaction** (s-wave only)

# $\Lambda(1405)$

## POSSIBLE RESONANT STATE IN PION-HYPERON SCATTERING\*

R. H. Dalitz and S. F. Tuan

Enrico Fermi Institute for Nuclear Studies and Department of Physics,  
University of Chicago, Chicago, Illinois

(Received April 27, 1959)

PhysRevLett.2.425

....

will be pointed out here that this situation makes it quite probable that there should exist a resonant state for pion-hyperon scattering at an energy of about 20 Mev below the  $K^- - p$  (c.m.) threshold energy. In the present discussion, charge-

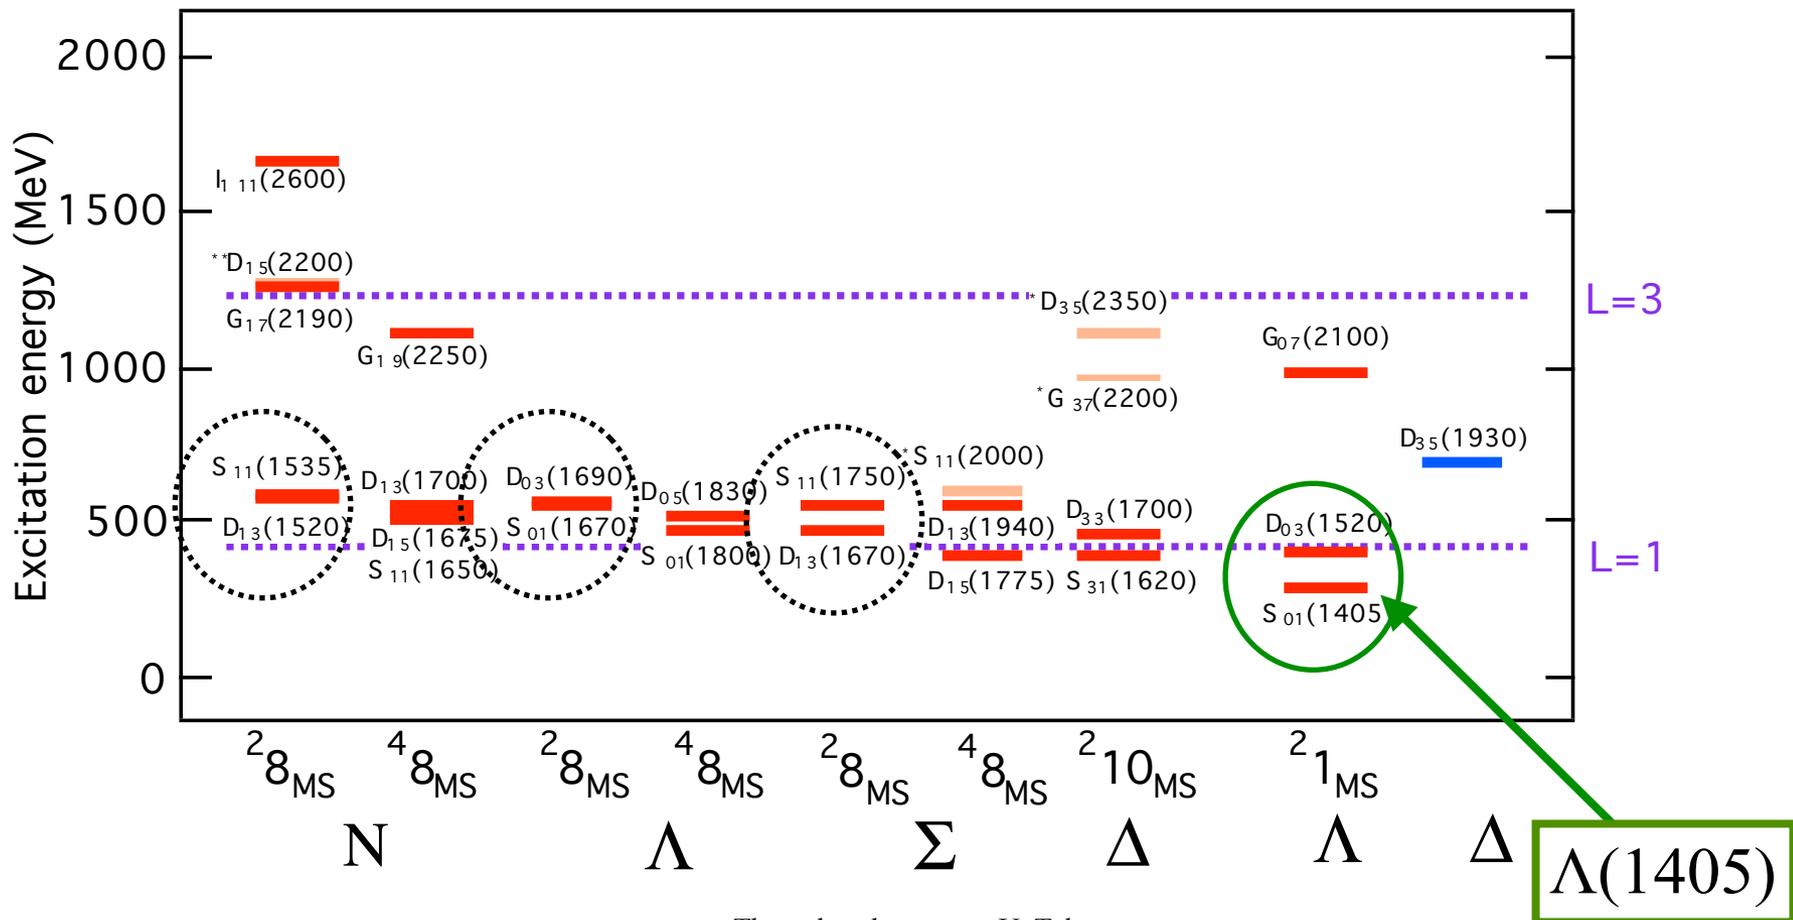

....

This is perhaps the first article which implied a hadronic molecule,  $K^{\text{bar}}-N$

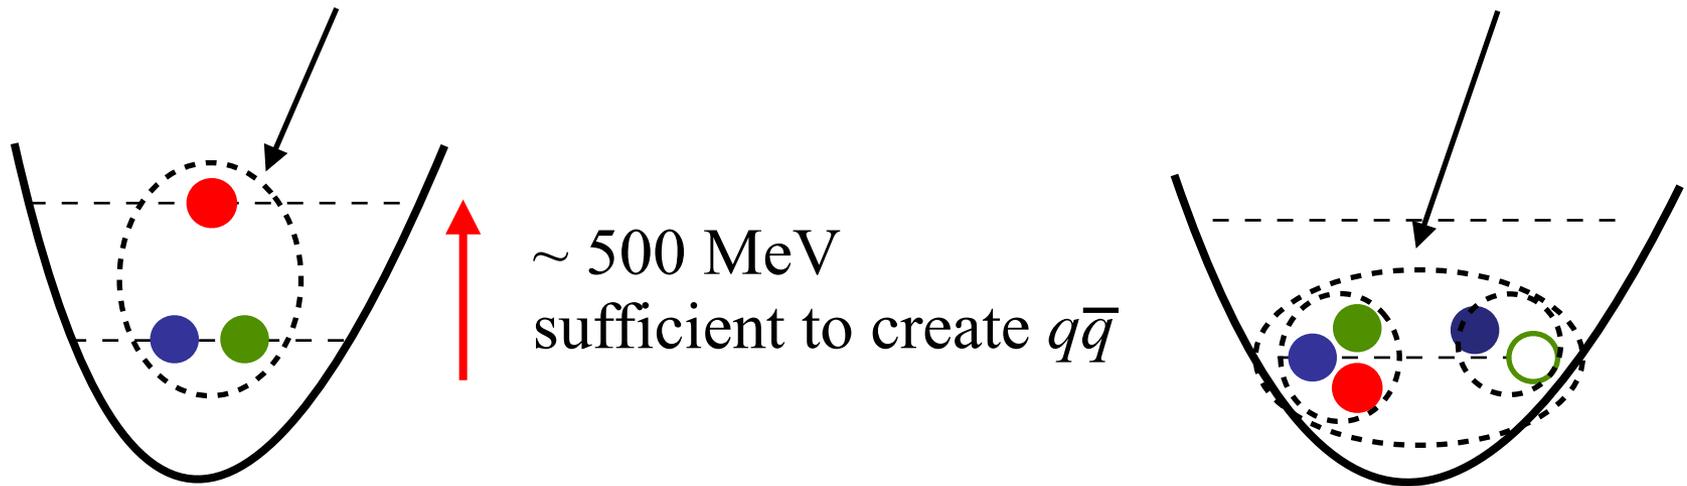

# Well established light baryon resonances measured from the corresponding ground states

M. Takayama, H. Toki and A. Hosaka, PTP101 (1999) 1271

## Negative parity baryons

# Quark excitations near **thresholds** reform molecules

More in the presence of *heavy quarks*

$\implies$

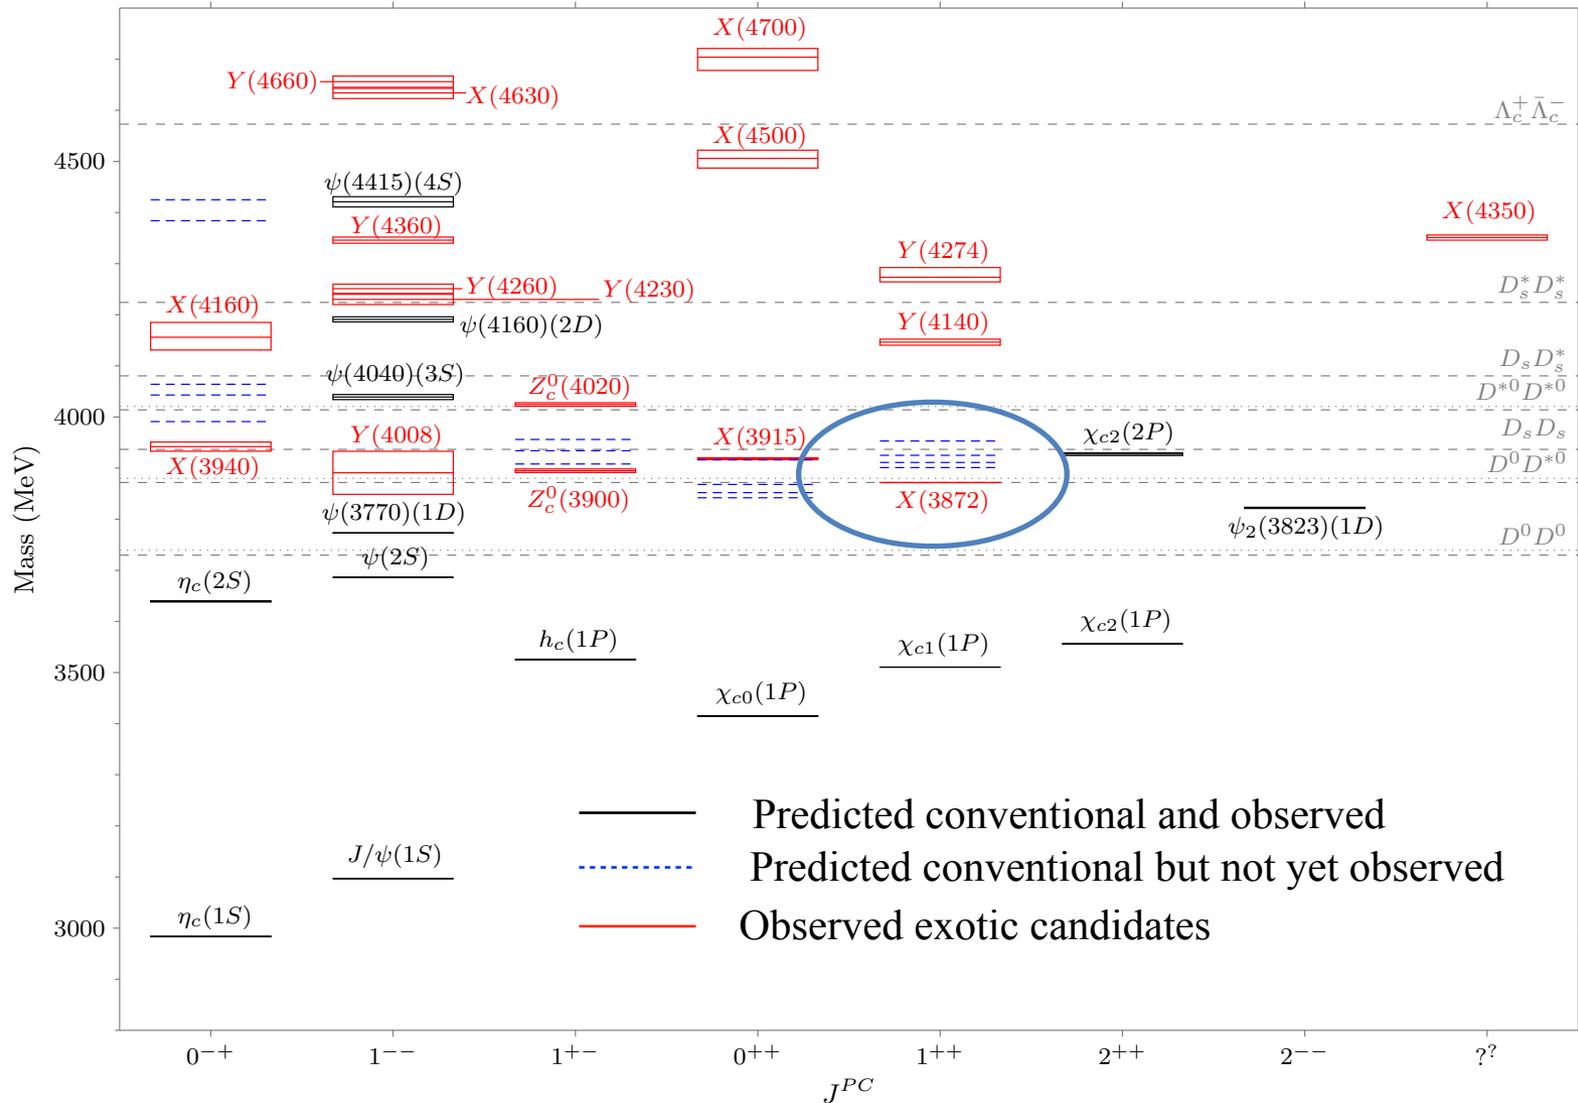

Recent findings of exotic hadrons,  $X, Y, Z$

For molecular states, *hadron-hadron interaction* is the key inputs

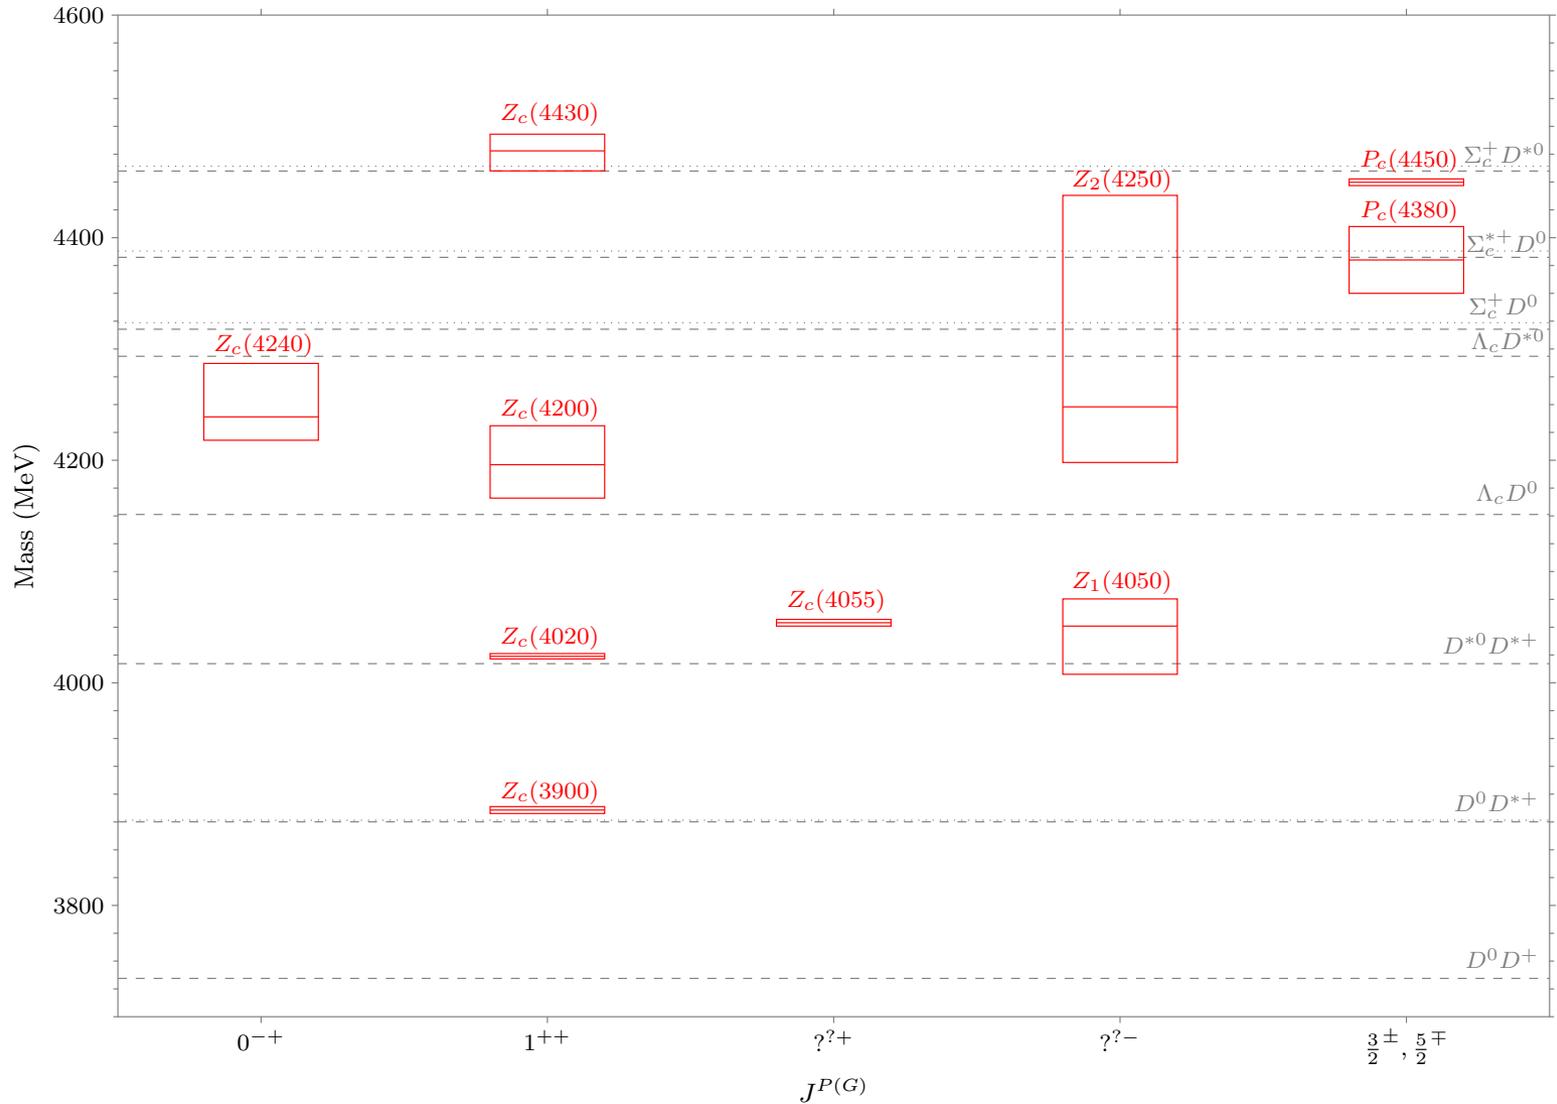

NN: many **experiments** and recent **lattice simulations**

$\pi(K)N$ : Low energy theorems, but limited applicability

# Neutral X, Y, Z<sub>0</sub> states

Received 29 September 1961

fields interacting through various types of coupling. The objective is the construction of a theory of self-interacting (boson) meson fields, which will admit states that have the phenomenological properties of (fermion) particles, interacting with mesons.

This programme is the obverse of the more fashionable endeavour to reduce the truly elementary particles to a set of spinor fields, out of which everything can be built by simple conjunction. It is a priori much less reasonable because, in particular, it is more difficult to construct half-integral representations of rotation groups out of integral than conversely; indeed it is patently impossible to do this within the limitations of a polynomial expansion. The hope that remains is that the particle-like states will be of a kind that cannot be reached by perturbation theory, and which cannot necessarily be discounted by general arguments. In the type of theory we are using the particle-like solutions have this character, arising from the fact that periodic, transcendental, functions

# Recipe 1: To make a nucleon

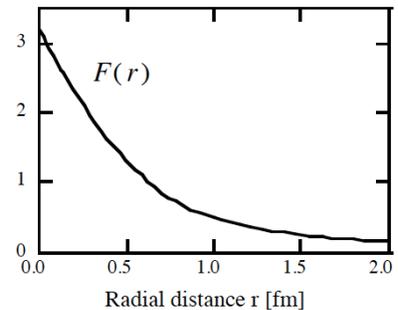

1. Prepare a **two-term Lagrangian** of the pion  
Positive and negative pressure terms  $\sim$  balance

$$L = \frac{f_\pi^2}{4} \text{tr} R_\mu R^\mu + \frac{1}{32e^2} \text{tr} [R_\mu, R^\nu]^2$$

2. Find a **classical hedgehog** solution of  $B = 1$  (winding number)  
Minimize the spin and isospin energy, **spin+isospin = 0**

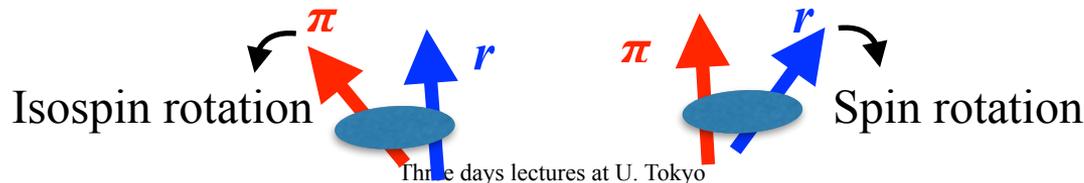

$$U = \exp(i\vec{\tau} \cdot \vec{\pi} / f_\pi) \rightarrow U_H = \exp(i\vec{\tau} \cdot \hat{r} F(r) / f_\pi)$$

3. Quantize its **spin-isospin rotations**

**Nucleons as rotating hedgehogs** (originally by **Pauli and Dankoff**)

$$U_H(\mathbf{x}) \rightarrow U_H(t, \mathbf{x}) = A(t) \exp[i\tau_a R_{ab}(t) \hat{r}_b F(r)] A^\dagger(t)$$

## The Pseudoscalar Meson Field with Strong Coupling

W. PAULI, *Institute for Advanced Study, Princeton, New Jersey*

(Received June 23, 1942)

The present paper treats the symmetrical and charged pseudoscalar theories of the meson field, using the strong coupling approximation; it restricts itself to the case of a single source. The energy levels of the excited states of the heavy particle and the scattering cross section for free mesons are computed by wave mechanical methods. An expression is also obtained for the magnetic moment of the proton or neutron. While the scattering cross section can, with reasonable assumptions, be brought into agreement with experimental values, the results for the magnetic moment are qualitatively at variance with the known values in that equal and opposite moments are predicted for proton and neutron.

# Toward the Nucleon and Kaon interaction

**Recipe 2a: Callan-Klebanov,  $1/N_c$ , strong copying limit, PAV**  
C. G. Callan, Jr. and I. R. Klebanov, Nucl. Phys. B 262, 365 (1985)

1. Prepare a hedgehog soliton

$$U_H = \exp(i\vec{\tau} \cdot \hat{r}F(r) / f_\pi)$$

2. Introduce a kaon around the hedgehog,  
find the wave equation and bound-state solutions (exists!)

$$U_{HK} = \sqrt{U_H} U_K \sqrt{U_H} \quad -\frac{1}{r^2} \frac{d}{dr} \left( r^2 h(r) \frac{dk_l^\alpha(r)}{dr} \right) - E^2 f(r) k_l^\alpha(r) + (m_K^2 + V(r)) k_l^\alpha(r) = 0$$

3. Quantize its spin-isospin for hyperons,  $\Lambda$ ,  $\Sigma$ , ...

$$U_{HK} \rightarrow A(t) U_{HK} A(t)^\dagger$$

This recipe follows the  $1/N_c$  expansion, kaon around the hedgehog  
 $\rightarrow$  transmutation of quantum numbers

*The kaon (boson) behaves as a strange quark (fermion)*

# Toward the Nucleon and Kaon interaction

**Recipe 2b: Ezoe-Hosaka**, violates  $1/N_c$ , weak copying limit, PBV  
Ezoe and Hosaka, Phys. Rev. D 4, no. 3, 034022 (2016); arXive:1703.01004

1. Prepare a nucleon as a rotating hedgehog

$$U_N = A(t) \exp(i\vec{\tau} \cdot \hat{r} F(r) / f_\pi) A(t)^\dagger$$

2. Introduce a kaon around 1, find the wave equation

$$U_{NK} = \sqrt{U_N} U_K \sqrt{U_N} \quad -\frac{1}{r^2} \frac{d}{dr} \left( r^2 h(r) \frac{dk_l^\alpha(r)}{dr} \right) - E^2 f(r) k_l^\alpha(r) + (m_K^2 + V(r)) k_l^\alpha(r) = 0$$

3. Find KN interactions from the wave equation

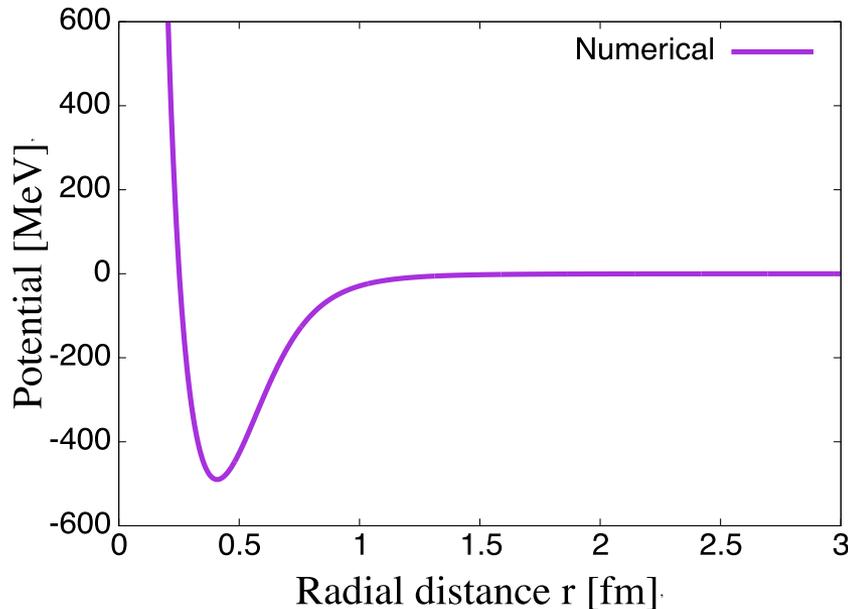

$$V(r) = V_C^{I=0}(r) + V_C^{I=1}(r) + V_{LS}^{I=0}(r) + V_{LS}^{I=1}(r)$$

No transmutation of quantum numbers

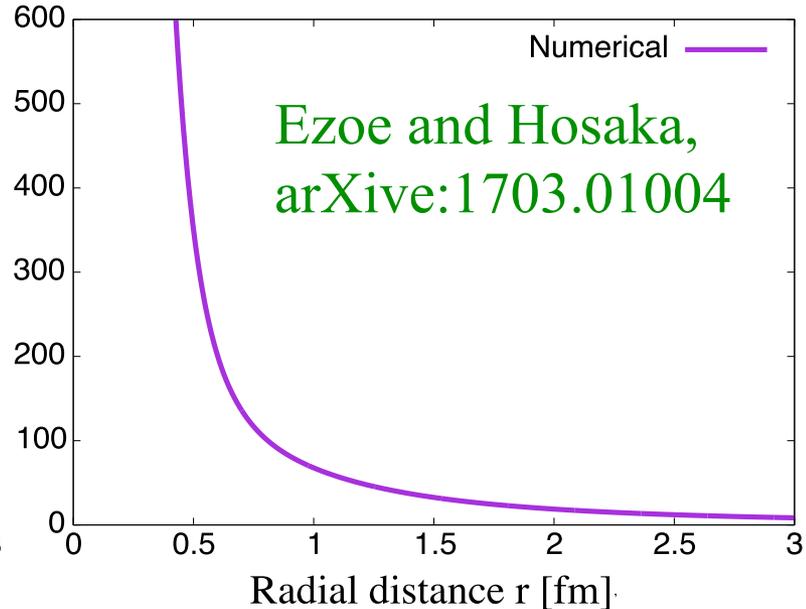

Physical kaon and nucleon interaction is obtained

# KN potential

$$I = 0, L = 0, J = 1/2$$

$$I = 0, L = 1, J = 3/2$$

- Qualitatively consistent with Chiral TW theorem
- Finite range reflecting the nucleon structure
- State dependent
- S-wave interaction has an attractive pocket
- Accommodates S-wave weakly bound state for  $\Lambda(1405)$
- Repulsive core which is the finding in the Skyrme model

# Summary and other issues

## Chiral symmetry

- Important ingredient of QCD and hadron dynamics
- Relates the mass generation and the NG modes
- Describes the low energy hadron dynamics
- Kaon (NG boson) interaction has been derived
- May explain the exotic structure of  $\Lambda(1405)$  as molecule

## What are not discussed

- Chiral multiples of different parities, mesons and baryons
- Recovery of the broken symmetry, Phase of QCD
- Property changes of hadrons
- Hadrons from Holography
